Ryszard Daniel, Tim Paulus, in Lock Gates and Other Closures in Hydraulic Projects, 2019. Abstract. Hydraulic gates can be classified with respect to various aspects, like the gate structural type, direction of movement, construction material, type of drive mechanism, and operation profile. Structural engineers most frequently use the first of these classifications.

Hydraulic downpull on downstream-seal, roller-mounted gates in entrance transitions of large conduits is primarily of concern to gate-hoisting equipment designers. The parameters obtained for the 17.50- by 22.89-foot San Luis gates can be adapted to the design of geometrically similar installations.

Hydraulic engineering as a sub-discipline of civil engineering is concerned with the flow and conveyance of fluids, principally water and sewage. One feature of these systems is the extensive use of gravity as the motive force to cause the movement of the fluids. This area of civil engineering is intimately related to the design of bridges, dams, channels, canals, and levees, and to both ...

Ryszard Daniel, Tim Paulus, in Lock Gates and Other Closures in Hydraulic Projects, 2019. Abstract. Hydraulic structures, including hydraulic gates, are assets for the organization that owns them. This is simply because they have actual value for the owner. Their value represents not only the original erection cost decreased by amortization, but also the actual performances of the structure.
