A machine is a human-made device that uses power to apply forces and control movement to perform an action. Machines can be driven by animals and people, by natural forces such as wind and water, and by chemical, thermal, or electrical power, and include a system of mechanisms that shape the actuator input to achieve a specific application of output forces and movement.

The Hoek-Brown criterion was introduced in 1980 to provide input for the design of underground excavations in rock. The criterion now incorporates both intact rock and discontinuities, such as joints, characterized by the geological strength index (GSI), into a system designed to estimate the mechanical behaviour of typical rock masses encountered in tunnels, slopes and foundations.

where L_{eff} is the effective length and L is the actual unsupported length of the column. For example, the theoretical effective length of a fixed-free column is $2L$. The fixed-free column is twice as susceptible to buckling as a pinned-pinned column, such that the fixed-free column is effectively twice as long as a pinned-pinned column with the same material and geometry (and so will buckle ...

Multi-supply voltage techniques require level shifters on signals that go from one voltage level to another. Without level shifters, signals that cross voltage levels will not be sampled correctly. It is suggested that formal techniques be used in the design flow to identify missing level shifters. Finding these missing definitions early will save time in... » read more
