In statistics, point estimation involves the use of sample data to calculate a single value (known as a point estimate since it identifies a point in some parameter space) which is to serve as a "best guess" or "best estimate" of an unknown population parameter (for example, the population mean).More formally, it is the application of a point estimator to the data to obtain a point estimate.

1. Statistics and induction. Statistics is a mathematical and conceptual discipline that focuses on the relation between data and hypotheses. The data are recordings of observations or events in a scientific study, e.g., a set of measurements of individuals from a population. The data actually obtained are variously called the sample, the sample data, or simply the data, and all possible ...

Introduction. Misinterpretation and abuse of statistical tests has been decried for decades, yet remains so rampant that some scientific journals discourage use of "statistical significance" (classifying results as "significant" or not based on a P value) [].One journal now bans all statistical tests and mathematically related procedures such as confidence intervals [], which has led ...

Fig. 2 shows the results of the same procedure for noisy data, σ = 1, and a larger training set, N train = 100.As in the noiseless case, the tenth order model provides the best fit to the data (i.e., the lowest E in).In contrast, the tenth order model now makes the worst out-of-sample predictions (i.e., the highest E out).Remarkably, this is true even if the data were generated using a tenth ...
